ABSTRACT OF THE DISCLOSURE

2 A method and apparatus for stabilizing adjacent vertebrae. Upper and lower
3 interlocking brackets are insertable in a prepared intervertebral space between adjacent
4 vertebrae. The brackets are affixed to the vertebrae at attachment plates. A rib on one
5 side of one bracket interlocks with a rib receiving groove in the other bracket to stabilize
6 the spinal column without eliminated mobility (forward and rearward flexion) of the
7 column. Various embodiments include additional shock absorption features.
